

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

**Chapman on New Colombian Birds.**<sup>1</sup>— Mr. Chapman in this paper, which is preliminary to a detailed one now in preparation, presents the first report on the results of the ornithological investigations of the American Museum expedition to Colombia, which was planned and directed by him, and with which he was personally associated from March to June, 1911. This contribution consists of a brief outline of the personnel and itinerary of the expedition to date, with a map and diagnoses of 40 new species and subspecies of birds.

While most of these are from the Cauca region, the Paramo of Santa Isabel and other parts of western Colombia others are from Santa Marta, and one, *Synallaxis gularis cinereiventris*, from Merada, Venezuela. The distinctness of these latter forms was brought out by a study of the Cauca material. The interest which attaches to this paper will make all students of the Neotropical avifauna eager for the appearance of Mr. Chapman's detailed report.— W. S.

**Chapman on a New Ibis from Mt. Kenia.**<sup>2</sup>— Mr. and Mrs. C. E. Akeley have presented to the American Museum a pair of Ibises with their nest, a portion of an egg-shell, and three young, which they collected on Mt. Kenia, British East Africa, in September, 1910. Mr. Chapman finds that the specimens represent not only a new species but a new generic type, most nearly related to *Hagedashia* but resembling in some respects *Lophotibis* and *Lamprolabis*. He has named the species *Oreolabis akeleyorum*.— W. S.

**Richmond on New Birds from the West Coast of Sumatra.**<sup>3</sup>— The collections made by Dr. W. L. Abbott in 1903 and 1904 on islands off the west coast of Sumatra, and presented to the United States National Museum, have yielded the following new forms which are here named and described by Dr. C. W. Richmond. *Muscadivores consobrina babiensis*, Pulo Babi; *Thriponax javensis buttikoferi*, Nias Island; *Dicæum sumatranum batuense*, Batu; *Alcedo meninting proxima*, North Pagi; *Copsychus saularis pagiensis*, North Pagi.— W. S.

**Beebe on New Blood Pheasants.**<sup>4</sup>— Mr. Beebe's study of the specimens of Pheasants obtained on the Kuser-Beebe Expedition has brought to light the existence of two undescribed forms of Blood Pheasant which are here
